

ABSTRACT

A brightness difference ornamental screen with multi-function includes an ornamental layer, a light display member and a control device for controlling the light display member. The ornamental layer is set up in front of the light display member. The light display member is connected to the control device. The ornamental layer is a semi-transparent pattern. The light display member is a light source. There are contents to be displayed behind the ornamental layer. The control device is a key or a touch switch or an electronic switch to make the light source turn on/off. The ornamental screen has functions as an ornament, as well as displays contents behind the ornamental layer. The ornamental screen has dual-purpose and may utilize space sufficiently, while its structure is simple and purpose is widespread.
